

Aerobic Treatment Units

SI Precast Concrete has partnered with several manufacturers of aerobic treatment units to answer the ever-growing demand of regulatory agencies requiring pretreatment of effluent prior to discharging to any type of disposal system and offers a full line of aerobic treatment units from Delta Environmental Products,

ClearStream Wastewater Systems, and Norweco, all leaders in the field of aerobic treatment products.

SI Precast Concrete provides residential treatment units that are certified NSF/ANSI Standard 40 Class I.

SI Precast also offers two different processes for the treatment of effluent. One process is the extended aeration mode of activated sludge. This process is often referred to as suspended growth process.

The other process is referred to as attached growth or fixed film. In this process, conditions are favorable only to attached growth bacteria therefore no mixed liquor suspended solids, which are common in an activated sludge process, are produced.

These products are driven by individual market demand. SI Precast Concrete has made it our priority to provide the appropriate product in any of the markets in which we do business.

Aerobic Treatment Units

Delivery available on all products.
